

The highest-carbon divisions lean most on non-measured heights

method Field-measured (HTCD 1) Crew estimate (HTCD 2/3, Part 1) FIA modeled (HTCD 4, Part 2)

The 12 highest-carbon divisions from Fig. 2, in the same rank order (highest first).
Pacific coast / Mediterranean-climate divisions (blue-heavy) carry 23-48% of their carbon on FIA-modeled heights;
Appalachian/eastern divisions in the same top 12 (grey-dominated) are built almost entirely on field measurements.
